Kodland — Digital Creativity | USA Tutor Hiring
Remote

Dear Kodland Hiring Team,

I am applying for the Digital Creativity tutor role. My two great passions are learning and communication, and between them they have taken me much further than I could have planned. I teach English online to children and teenagers, and I make digital things for a living — Blender 3D, WebGL scenes, brand design and animation. Kodland's design track teaches the same software I use daily, which is why this role fits me unusually well.

Teaching young people is the part I am most confident in. I have spent eight years teaching English one-to-one and in small groups to learners from age eight through adulthood — at Allschool and Fluentify, in a German gymnasium and in a South African primary school — and I also teach guitar online, so one-to-one tuition over video is simply my default working mode. I teach English and Scratch coding at the same time: the coding is the content and the English is the medium. With beginners I have the student direct the game, giving me the instructions and describing what happens on screen instead of repeating vocabulary — and it works: a seven-year-old student of mine now needs work two years above her year group to stay challenged, and she is the pupil chosen to speak for the school when exchange students visit. Two of my years were spent in special education, supporting students with ADHD, ADD and Autism, where I learned to break a task down until a struggling learner could succeed at it. That is the skill I would bring to a Kodland classroom above all others.

The digital side is not a hobby I would be learning on the job. I build interactive 3D in Three.js and WebGL with custom shaders and particle systems; I model, texture and render in Blender; I design brand assets in Canva and Photopea; and I have shipped learning products for children, including a gamified vocabulary trainer and 1,452 speaking prompts. Your 3D modelling course for teens teaches Blender, which I already work in — I would be teaching from hands-on experience, not from a script I had just read. And you can see two things I built and shipped: DOH // ORBITAL CORE, a circular Tetris in plain HTML5 canvas (wgt-edutech.github.io/orbital-core), and Scalien, a fretboard analysis app that maps scales and chords onto a guitar neck (articulate-english.github.io/scalien).

Two things worth knowing about how I work. First, I track progress properly: I run regular assessments, keep notes per student, and adjust the plan when a learner plateaus rather than pushing on regardless. Second, I am comfortable with Kodland's structure — following provided scripts and materials, then feeding back what actually happened in the room. The value I add is knowing which moment to slow down for.

Availability: 10 or more hours weekly within your windows — weekdays 17:00–22:00 and weekends 10:00–22:00 Boston time. Setup: stable high-speed connection, HD webcam, headset, quiet dedicated workspace, and screen-sharing for live demonstration of 3D and design software.

I recently founded WGT EduTech to normalise gamified learning — the studio behind everything above — and I am saving for a drawing tablet, for a 2D animation I want to make.

I would welcome a mock lesson. Thank you for your consideration.

Yours sincerely,
WILLIAM GRAY THOMASON
